- The field of behavior disorders in children and adolescents has emerged as a major focus of psychologists, teachers, administrators, state and federal governments, and the general public. There are so many problems regarding students in which, Learning Disability is one of them.
  - Learning disability is a specific impairment of academic learning that interferes with a specific aspect of schoolwork and that reduces a student's academic performance significantly. A learning problem is not considered a learning disability if it stems from physical, sensory, or motor handicaps, or from generalized intellectual impairment
  - Learning disabilities represent one of the most prevalent forms of learner problems; it is also a field of study that is replete with controversy as to classification, assessment, and intervention. It is also a domain that crosses over a wide range of professionals and research perspectives- Educators, Psychologists, Neurologists, Pediatricians, Neuropsychologists, and others.
- 

## CHARACTERISTICS OF CHILDREN WITH LEARNING DISABILITY
